

## Online acoustic guitar tuner

You should be sure to do your acoustic guitar tuning each time you sit down to play, whether you are practicing or performing. It's pretty unpleasant to try to make beautiful music on an untuned guitar. Lots of guitar students think their inexperience is ruining the sound, not understanding the importance of doing their tuning regularly. You will be much more successful in your music making if you set aside that small amount of time it takes to tune your instrument properly.

Pluck the string you want to tune. If you use an electronic tuner, the tuner's built-in microphone will pick up the sound. Look at the indicator. It could be a flashing light and/or a meter. It will tell you how close you are to the right pitch and whether you are sharp or flat. Adjust your acoustic guitar tuning accordingly by tuning the string's tuning key.

Taking your strings from looser to tighter will tune your guitar, also called tuning down. If the string is too tight, you will need to get it in tune by loosening the strings slightly and then tightening it again until it is in tune. Tuning up will give you a more true tone than tuning down.

A reference pitch source is needed whether or not you want to use an electric tuner when learning how to tune your guitar. Some options as to other things you can use are a tuning fork, another in tune guitar, a piano, or an MP3 that you know is in tune. Your results will always be accurate if you use an electric tuner when acoustic guitar tuning. If you'd like to try it the old fashioned way, an electric tuner will be helpful if you'd like to check your results.

To begin tuning your guitar, use the reference pitch to tune the sixth string (the thickest string) to low E. Once this string sounds right, the other strings can be tuned to their correct pitch based on that note. There is a reason why this technique works, but the explanation is long. Acoustic guitar tuning is a bit like driving. You don't have to understand the internal combustion engine to drive a car, and you don't have to understand music theory to tune your guitar.

Here's how to do your acoustic guitar tuning: 1. Strum (in tune) the sixth string on the fifth fret. Tune the open fifth string to that exact note. 2. Strum the fifth string on the fifth fret. Tune the open fourth string to the same note. 3. Tune the fourth string on the fifth fret. Tune the open third to the same note. 4. Follow closely; this is different than the above. Play the third string on the fourth fret and tune the open second string to this note. 5. Play the second string on the fifth fret and tune your open first string to this note.

Before you try acoustic guitar tuning for the first time, have an experienced player show you the ropes. The best place to learn is probably the music shop where you bought your acoustic guitar. After a few tries, you'll get the hang of it. You have to put time and effort into mastering the skill of acoustic guitar tuning. It's a whole lot easier for someone just starting out to use an electronic tuner instead. Since they only cost about \$20, they are well worth their price. What's more, if you choose one that was manufactured especially for use with guitars, it can actually let you know which string you're playing too.
